

Glycans in Pathway Tools

by

Markus Krummenacker

SRI International

Q1 2013

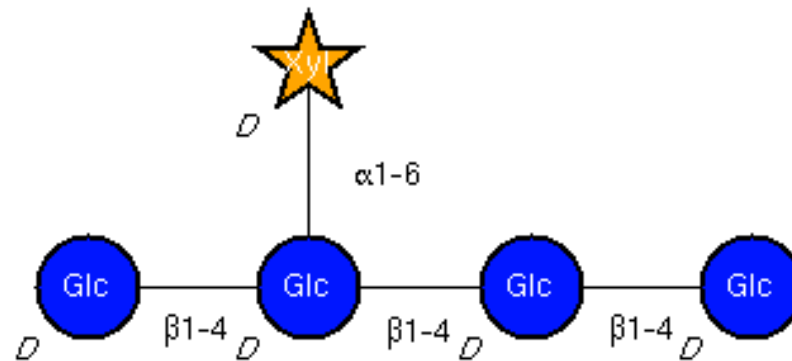

What are Glycans ?

- Macromolecules: Polysaccharides or Oligosaccharides
- Decoration of proteins or lipids
- Structural materials, cell walls: cellulose, chitin
- Storage polymers: glycogen, amylose
- Structures often contain 100s or 1000s of saccharide units
- Important biochemically, and for Biofuel production

Goals for Pathway Tools

- Glycan structures can be very big
- Showing big glycans in atomic detail results in overwhelming clutter
- Instead, icons with colors clarify what the building-blocks are and how they are connected
- Support editing and display of glycans
- For Biofuel production, the goal is to display summarized degradation pathways

Icons clarify glycan structure

Chosen Representation Standards

- Display:
 - CFG icons (Consortium for Functional Glycomics)
 - Different shapes and colors are combined to represent saccharide units
 - Standard chemical modifications have their own icons

CFG Icons

Extended Carbohydrate Symbol Notation

New Symbols are in the gray boxes.

**Hexoses: All NAc's and amines are in the two position.
All A's are in the 5 position.**

Glucose		GlcNAc		GlcN		GlcA	
Galactose		GalNAc		GalN		GalA	
Mannose		ManNAc		ManN		ManA	
Idose		IdoNAc		IdoN		IdoA	
Gulose		GulNAc		GulN		GulA	
Altrose		AltNAc		AltN		AltA	
Talose		TalNAc		TalN		TalA	
Allose		AlfNAc		AlfN		AlfA	

6-Deoxy Sugars: All NAc's and amines are in the two position.

Fucose		FucNAc		FucN	
Quinovose		QuiNAc		QuiN	
Rhamnose		RhaNAc		RhaN	

Pentoses	
Ribose	
Arabinose	
Xylose	
Lyxose	

Ketoses	
Fructose	
Sorbose	
Psicose	
Tagatose	

Sialic Acids:

Neu5Ac	
Neu5Gc	
KDN	

Ulosonic acids:

Pseudaminic acid	
Legionaminic acid	
8-Epi-legionaminic acid	
4-Epi-legionaminic acid	

Other:

KDO	
-----	--

Sugar is L-configuration: (Draw to bottom-left of sugar)	L	Example:	indicates L-Rhap
Sugar is D-configuration: (Draw to bottom-left of sugar)	D	Example:	indicates D-Rhap

**All Sugars by default are in the pyranose form.
If clarification or emphasis is needed, do as below:**

Sugar is in furanose form: (Draw inside sugar)	f	Example:	indicates Ribf
Sugar is in pyranose form: (Draw inside sugar)	p	Example:	indicates Frup

Substituted functional groups are connected to the specified carbon:

-4)-β-D-Quip3NAc-(1-6)-α-D-GlcpNAc-(1-4)-β-D-GlcpA-(1-3)-α-D-GalpNAc-(1-

Carbohydrate Research 2004, 339, 409-413.

Chosen Representation Standards

- File exchange:
 - GlycoCT XML
 - GlycoCT has 3 flavors: XML, condensed, compressed
 - Namespaces of all entities are controlled
 - Canonical numbering of residues and linkages
 - Allows a variety of chemical modifications of residues
 - Allows repetitive segments, structural ambiguities

GlycoCT technical details

Examples

b-dglc-hex-1:5

β-D-Glucose, pyranose form

GlycanBuilder

- Open source JAVA applet, developed by the EUROCarbDB project
- Uses layout algorithms to draw glycans in standardized ways
- Pathway Tools communicates with GB by starting a local HTTP server, launching a Web browser, and displaying GB in the browser, while exchanging the glycan structure as GlycoCT XML (similar to the Marvin compound editor applet)
- Glycan icon structures are available for compounds under the Glycans class

Editing with GlycanBuilder

Edit Glycan Structure of CPD-13416 - Mozilla Firefox

File Edit View History Bookmarks Tools Help

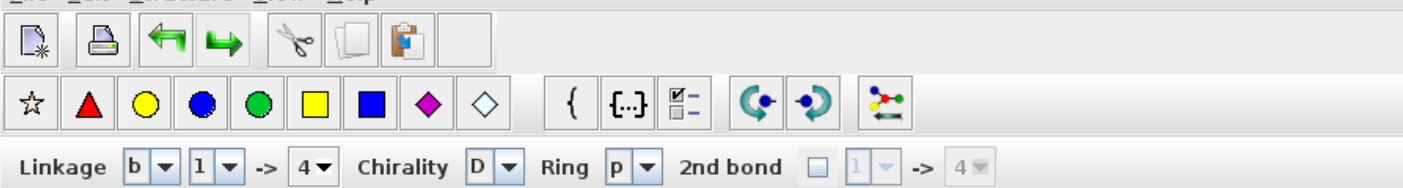

Edit Glycan Structure of CPD-13416

Linkage **b** **1** -> **4** Chirality **D** Ring **p** 2nd bond **1** -> **4**

m/z: 1045.5037 [MONO,perMe,Na,0,freeEnd]

Pathway Tools technical details

- Compounds under the class Glycans can have both a traditional atomic structure and a icon structure
- Layout coordinates are sent by GlycanBuilder (special extension)
- Additional slots record icon structure:
 - GROUP-COORDS-2D: (186 82), (134 82), (82 82), (30 82), (82 30)
 - STRUCTURE-GROUPS: |B-DGLC-HEX-1:5|, |B-DGLC-HEX-1:5|, |B-DGLC-HEX-1:5|, |B-DGLC-HEX-1:5|, |A-DXYL-PEN-1:5|
 - STRUCTURE-LINKS: (1 2 O 4 D 1), (2 3 O 4 D 1), (3 4 O 4 D 1), (3 5 O 6 D 1)

Future Work

- Support for non-canonical NON residues. Extend GlycanBuilder to enter free-form text for them.
- Support polymer repeat units
- Implement Glycan (degradation) pathway displays that show at which linkages enzymes act
- Consistency checks between traditional compound structure versus icon structure, if both are present
