README.md

Streptomyces_coelicolor-GEM

- Brief Repository Description

This repository contains a genome-scale metabolic model **Sco4** for the antibiotic producer *Streptomyces coelicolor* A3(2), a representative species of *Actinomycetales*.

- Abstract:

Streptomyces coelicolor is a representative species of soil-dwelling, filamentous and gram-positive actinobacterium harbouring enriched secondary metabolite biosynthesis gene clusters. As a well-known pharmaceutical and bioactive compound producer, *S. coelicolor* has been exploited for antibiotic and secondary metabolite production. Here, we present the updated model Sco4, which refers to the fourth major release of *S. coelicolor* GEM and with increased coverage of both primary and secondary metabolism through using the [RAVEN](#) Toolbox ver 2.0. The Sco4 model was expanded with 398 new metabolic reactions and 314 newly associated enzyme-coding genes, which encoded a variety of biosynthetic pathways for known secondary metabolites (e.g. 2-methylisoborneol, albaflavone, desferrioxamine, geosmin, hopanoid and flaviolin dimer). The Sco4 model can be used as an upgraded platform for future systems biology research on *S. coelicolor* and related species.

Summary

- RAVEN Matlab Toolbox on GitHub
- Combines multiple data sources (MetaCyc, KEGG)
- Mass and charge balance
- An efficient platform for high quality draft model reconstruction
- Transport and spontaneous reactions
- A wide range of flux analysis functions
- Improved compatibility (Import/Export, COBRA)
- Useful in updating existing GEMs
