

Comparison of multiple *E. coli* models reveals unique metabolic phenotypes

March 5, 2013
Jonathan Monk

Outline

- *E. coli*: from strain to species
- Core and Pan genomes/reactomes
- Metabolic Network Reconstruction Procedure
- Phenotypic Predictions
- Experimental Validation

Escherichia coli: from Strain to Species

- Predominant facultative anaerobe resident in the human gut
 - Most live as harmless commensals
 - Colonizes infant human gut within hours of birth
- Species also has many pathogenic members
 - Extraintestinal Pathogens (ExPEC)
 - Urinary infections, septicaemia and meningitis
 - Intestinal (InPEC):
 - 6 categories of intestinal infection:
 - EAEC, EIEC, EPEC, ETEC, EHEC and DAEC
- Additionally, has to survive outside gut for extended periods

Nature Reviews | Microbiology

***E. coli* exhibits a remarkable variety of lifestyles!**

K-12 is not representative of *E. coli* species

- History of K-12:
 - Isolated from feces of a convalescent diphtheria patient in 1922
 - Adopted as a model organism in the 1940s
 - Likely underwent repeated subculture and/or storage in stab culture during interim 20 years
 - Later, underwent rounds of mutagenesis
 - UV light treatment to remove phage lambda
 - Acridine orange to remove F plasmid
 - Genome sequenced in 1997
- *E. coli* O157:H7 genome sequenced in 2001: remarkably has **1 million more base pairs than K-12**

E. Coli K-12
MG1655
4.6 Mbp

Blattner, F. R. (1997). The Complete Genome Sequence of *Escherichia coli* K-12. *Science*, 277(5331), 1453-1462. doi:10.1126/science.277.5331.1453

E. Coli O157:H7
EDL933
5.5 Mbp

Perna, N. T., Plunkett, G., Burland, V., Mau, B., Glasner, J. D., Rose, D. J., Mayhew, G. F., et al. (2001). Genome sequence of enterohaemorrhagic *Escherichia coli* O157:H7. *Nature*, 409(6819), 529-33. doi:10.1038/35054089

Core vs Pan genome

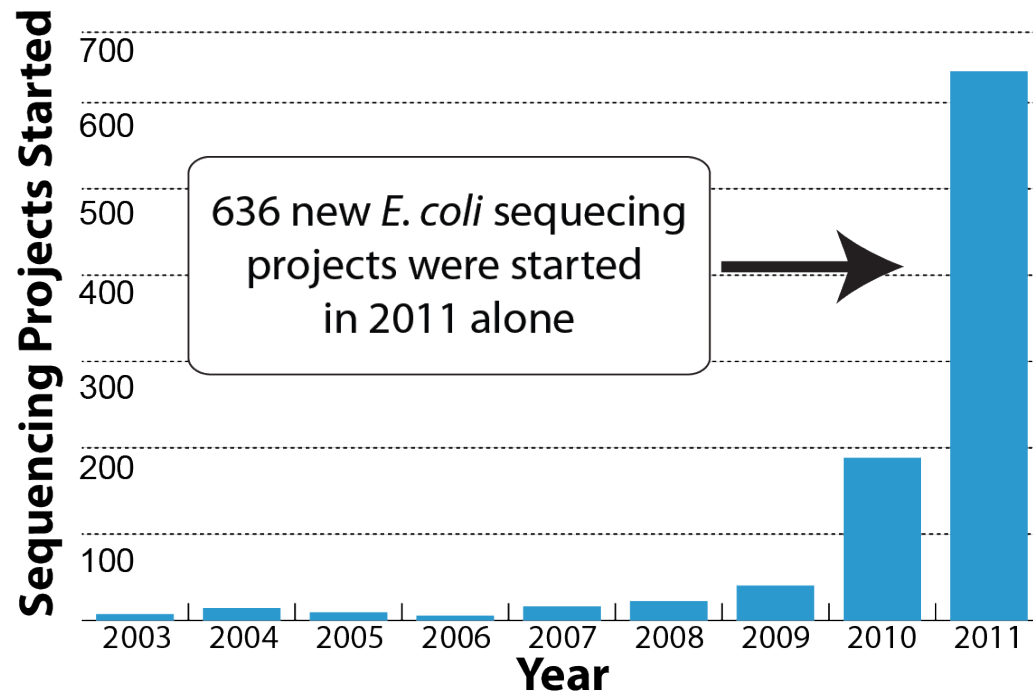

- **Core genome:** Genes present in **every** member of a species
“essence of the species”
- **Pan genome:** Variable genes present in **any** member of a species
- For *E. coli*: currently 15,000 gene families predicted in pangenome, ~2,000 in core genome
- Estimated to be nearly 45,000 in pan genome of *E. coli*

Snipen, L., Almøy, T., & Ussery, D. W. (2009). Microbial comparative pan-genomics using binomial mixture models. *BMC genomics*, 10, 385. doi:10.1186/1471-2164-10-385

Lukjancenko, O., Wassenaar, T. M., & Ussery, D. W. (2010). Comparison of 61 sequenced Escherichia coli genomes. *Microbial ecology*, 60(4), 708-20. doi:10.1007/s00248-010-9717-3

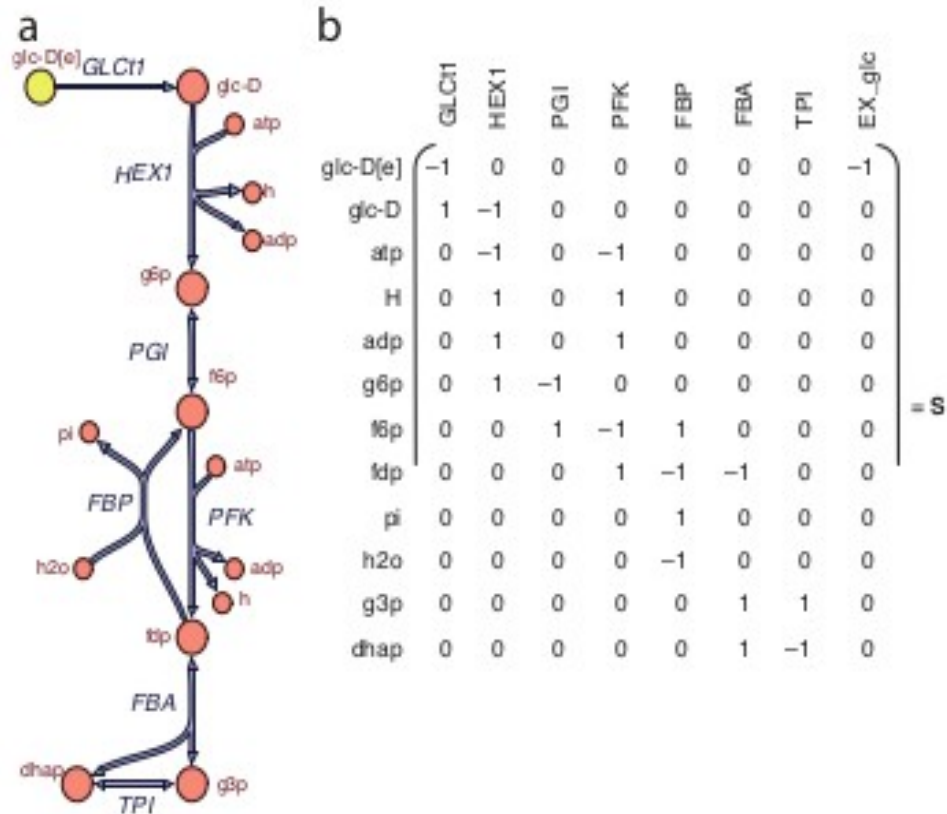

Increase in *E. coli* genome sequences

- Need tools to analyze these sequences
- Metabolic reconstructions are one solution
- Many core genes are metabolic

Genome Scale Metabolic Reconstructions

- Take into account all known metabolic reactions in an organism
- Flux Balance Analysis can be used to examine these networks:
 - Allows calculation of phenotypic states
 - Bridges genotype with phenotype through GPRs (gene-protein-reaction relation)

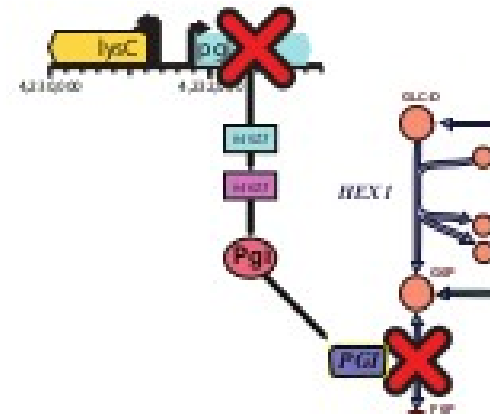

Genome Scale Metabolic Reconstructions

- Take into account all known metabolic reactions in an organism
- Flux Balance Analysis can be used to examine this networks:
 - Allows calculation of phenotypic states
 - Bridges genotype with phenotype through GPRs (gene-protein-reactions relation)

Reconstruction Process

Curated enterobacteria reconstructions

Annotated genomes

Network reconstructions

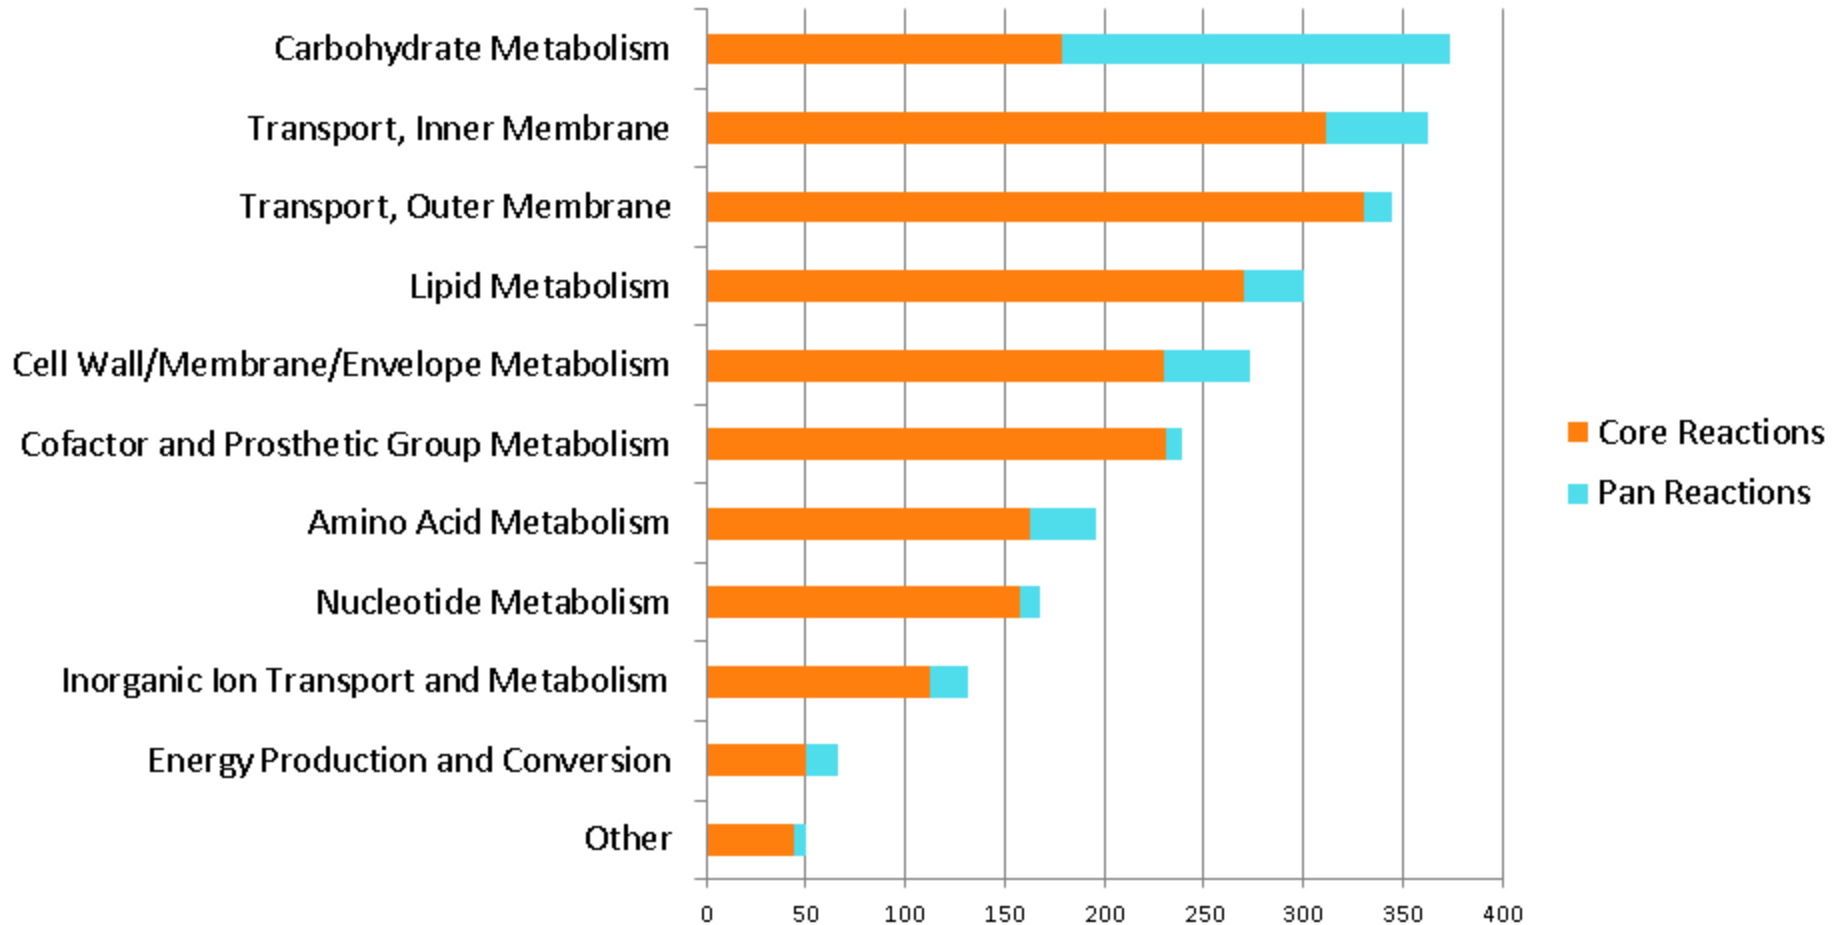

Computed phenotypes

- Reconstruction content mapped to complete annotated genomes using GPRs
 - Using BBH and genetic context
 - Supplemented with information from Model Seed and Ecocyc/Metacyc
 - Manually curated

E. coli Core and Pan Reactions by System

Flux Balance Analysis

- Allows simulation of growth capabilities in different conditions:
 - Profiled growth *in-silico* in more than 650 conditions that support growth in at least one strain:
 - C-sources: 199 aerobic, 163 anaerobic
 - N-Sources: 96 aerobic, 79 anaerobic
 - P-Sources: 12 aerobic, 12 anaerobic
 - S-Sources: 12 aerobic, 1 anaerobic

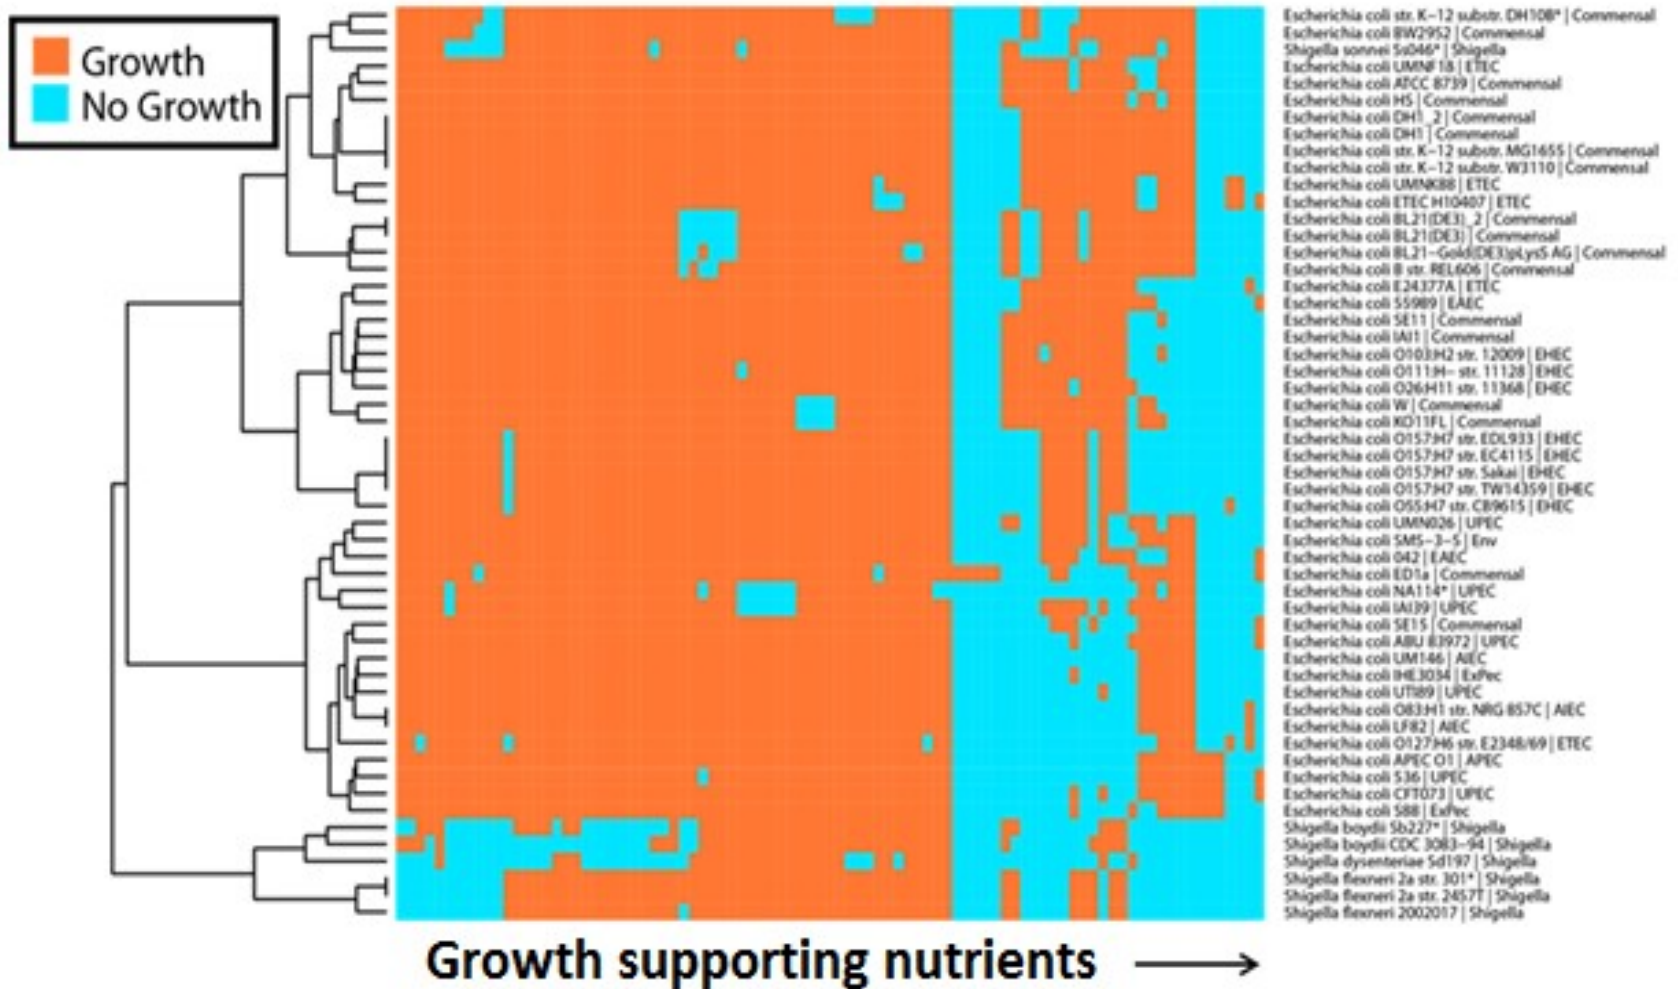

E. coli growth capabilities

Percentage of *E. coli* strains that grow on substrate

20 most variable carbon sources (aerobic)

Growth predictions for *E. coli*/*Shigella*

Experimental Validation

- Obtained 12 strains from diverse pathotypes
 - EHEC, UPEC, DAEC, Shigella, Commensal
- Purchased difference driving carbon and nitrogen sources to test
- 4 possible outcomes
 - Correct Model Predictions:
 - True Positives, True Negatives
 - False Model Predictions:
 - False Negative: No pathway present
 - Drives discovery of new biology
 - False Positive: Pathway is present, but strain doesn't grow.
 - Could be explained by regulation
- Biolog technology is perfect for this study!
 - Except for some documented inconsistencies!

Example of Inconsistencies

- Compared Biolog datasets from two studies:
 - The evolution of metabolic networks of *E. coli*
 - David J Baumler^{1*}, Roman G Peplinski¹, Jennifer L Reed², Jeremy D Glasner¹ and Nicole T Perna^{1,3}
 - The decoupling between genetic structure and metabolic phenotypes in *Escherichia coli* leads to continuous phenotypic diversity
 - V Sabarwal,^{*†‡} O Bouvet,[†] J Glodt,[†] O Clermont,[†] D Skurnik,[†] L Diancourt,[§] D de Vienne,[‡] E Denamur,[†] and C Dillmann
- Three strains overlap: K-12MG1655, EDL933 and CFT073
 - Large number of growth/no growth inconsistencies

Biolog Growth Comparisons

Baumler
PM1 plate
5 strains

Sabarly
GN2 Plate
12 strains

95 C sources each

Overlap:
57 C sources
3 Strains: K-12 MG1655,
EDL933 and CFT073

- Baumler predicts growth on many more C sources
- Different protocols:
 - Major difference:
 - Baumler grew for 48 hours
 - Sabarly grew for 18 hours

Difficult to compare results to each other

EDL933

CFT073

Inconsistencies in protocol?

- Different shaking/aeration?
- Growth time 18 hrs (Sabarly) vs 40hrs (Baumler)
- Evaporation?
- Different plates?? GN2 vs PM plates
- Possibly different strains?
- Pre-culture conditions?
- Growth calling threshold

Thank you
